Reratoconus is a noninflammatory disease characterized by thinning and scarring of the central portion of the cornea. SIMILARITY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS (SLRPS) FAMILY. CLASS II SUBFAMILY.
SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).
transparency and for the structure of the stromal matrix. SUBCELULAR LOCATION: Extracellular matrix (Potential).

IISSUE SPECIFICITY: Cornea. Also detected in trachea, and in low levels, in intestine, skeletal muscle, ovary, lung and putamen. PTM: Binds keratan sulfate chains (By similarity).

DISBASE: Defects in KERA are the cause of the autosomal recessive cornea plana 2 (CNA2). In CNA2, the forward convex curvature is flattened, leading to a decrease in refraction, reduced visual activity, extreme hyperopia (usually plus 10 d or more), hazy corneal limbus, opacities in the corneal parenchyma, and marked arcus senilis (often detected at an early age). CNA2 is a rare disorder with a worldwide distribution, but a high prevalence in

May have a primary role in collagen fibrillogenesis (By similarity).
-!- SUBGNIT: Binds to type I and type II collagen (By similarity).
-!- SUBCELLULAR LOCATION: Extracellular matrix.
-!- PTM: Binds keratan sulfate chains (By similarity).
-!- SIMILARITY: BELONGS TO THE SMALL LEUCINB-RICH PROTEOGLYCANS (SLRPS) FAMILY. CLASS II SUBFAMILY.
-!- SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).

Cell Biol. 141:839-847(1998).
-1- FUNCTION: May be implicated in biomineralization processes. Has a function in binding of osteoblasts via the alpha(V)beta(3)-
                                                                                                                                                                                                                                                                                                                                                                                                                                          SUBGUNIT: Binds the alpha(V)beta(3)-integrin.
SUBCELULAR LOCATION: Extracellular matrix (Potential).
TISSUE SPECIFICITY: Bone-specific.
PTM: The N-terminus is blocked.
PTM: Some of the oligosaccharides are extended to keratan sulfate

SUBUNIT: Binds to type I and type II collagen.
SUBCELGUARA LOCATION: Extracellular matrix.
TISSUE SPECIFICITY: Highest levels observed in knee epiphysis, in calvarial and diaphyseal bone, in nasal and costal cartilage, in the eye, and in bladder. In mature knee joint it is mostly present in the proliferating zone of growth plate. It is also observed in ligaments, especially at insertion sites, in the junction between meniscus and joint capsule, in the perimysium of skeletal muscle
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 protein) (Keratan

Submitted (FEB-1994) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: Affects the rate of fibrils formation. May have a
primary role in collagon fibrillogenesis (By Similarity).
-!- SUBGNIT: Binds to type I and type II collagen (By Similarity).
-!- SUBCELLULAR LOCATION: Extracellular matrix.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Extracellular matrix; Proteoglycan;
Signal; Sulfation.
                                                                                                                                               Integrin (By similarity).
SUBUNIT: Binds the alpha(V)beta(3)-integrin (By similarity).
SUBCELLULAR LOCATION: Extracellular matrix (Potential).
TISSUE SPECIFICITY: Bone-specific.
PTM: Binds keratan sulfate chains (By similarity).
FTM: Sulfated on tyrosine residue(s) (By similarity).
FTM: SLIFATTY: BELONGS TO THE SMALL LEUCINE-RICH PROTEOGLYCANS (SLRPS) FAMILY: CLASS II SUBFAMILY.
SIMILARITY: CONTAINS 12 LEUCINE-RICH REPEATS (LRR).
                                                              protein; osteomodulin.";
Submitted (OCT-1997) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: May be implicated in biomineralization processes:
function in binding of osteoblasts via the alpha(V)beta(3)-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (POTENTIAL)

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
